Site_1: EcoRI; Site_2: XhoI; Seeds of barley (Hordeum vulgare L. cv. DickToo) were germinated in dishpans containing UCR-mix soil. Seedlings were kept in a growth chamber at 20C (day/night) and allowed to grow at 60-70% soil moisture content. After 3-4 days, the water was withheld in order to apply drought until the soil moisture content was reduced to 10-12%, which took another 3-4 days. At the time of extraction of epidermis, leaf water and osmotic potentials and extracted lower epidermis osmotic potentials had dropped to 15.9%, 20.2% and 24.7% of controls, respectively, as determined using a vapor pressure osmometer (Model 5100C, Wescor, Inc., Logan, UT). Epidermal strips were quickly peeled off of seedlings and immediately submerged in liquid nitrogen. About 15-20 g of epidermal tissue was collected and used to extract total RNA. Total RNA was extracted using Concert plant RNA Reagent (Invitrogen 12322-012). Poly(A) RNA was purified using bolyATTack mRNA Isolation System IV (Promega). A cDNA library was made using a Uni-ZAP cDNA synthesis kit (Stratagene). A total of 1 million primary lambda cDNA clones were mass-excised in vivo to give a population of pBluescript SK(-) phagemids. All steps to this point were performed in the TJ Close lab at the University of California, Plasmid DNA purified, cDNA clones archived, and DNA sequences determined using the TJ primer (mainly 3' end reads) using an AB13730 at the Arizona Genomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          timothy.close@ucr.edu

                                                                                                                                                                                                                                                                                                                                                                                                Inter Yector: Lambda Uni-ZAP XR, excised phagemid; Site 1: ECORI; Site 2: XhOI; Seeds of barley (Hordeum vulgare L. cv. DickToo) were germinated in dishpans containing UCR-mix soil. Seedlings were kept in a growth chamber at 20C (day/night) and allowed to grow at 60-70% soil moisture content. After 3-4 days, the water was withheld in order to apply drought until the soil moisture content was reduced to 10-12%, which took another 3-4 days. At the time of extraction of epidermis, leaf water and osmotic potentials and extracted lower epidermis of controls, respectively, as determined using a vapor pressure osmometer (Model 5100C, Wescor, Inc., Logan, UT). Epidermal tissue was collected and used to extract total needlately submerged in liquid nitrogen. About 15-20 g of epidermal tissue was collected using Concert plant RNA Reagent (Invitrogen 1232-012). Poly(A) RNA was purified using PolyATrack mRNA Isolation System IV (Promega). A cDNA library was made using a Uni-ZAP cDNA synthesis kit (Stratagene). A total of 1 million primary lambda cDNA clones were mass-excised in vivo to give a population of performed in the TJ Close lab at the University of California, Riverside by A. Wahid with some assistance from R.D. Fenton. Phagemids were plated on the TJC121 host strain, plasmid DNA purified, cDNA clones archived, and DNA sequences determined using the TJ primer (mainly 3' end reads) using an ABIJ730 at the Arizona Genomics Institute, University of Arizona (Collura, Feuerbacher, Kim, Kudrna, Wing, Yu). Chromatogram files were transmitted to UC Riverside (by Yu), then processed at UC Riverside (by Contagined to GenBank "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             timothy.close@ucr.edu

EcoRI-NotI cut cDNA was then ligated into the vector. Vector: pBluescript II KS(+); Site_1: EcoRI; Site_2: NotI Host: Escherichia coli DH10B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    σ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequencing project.

1. (bases 1 to 2176)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gallus
                                                                                                                                                                                                                                                                                                                                    BBSRC/Dundee/Nottingham/Sanger/Sheffield/UMIST cDNA collection, 
from a library constructed by Elizabeth Bosch. cDNA was prepared 
from RNA extracted from limbs, normalised, and poly A-trimmed. 
ECORI-NOtI cut cDNA was then ligated into the vector. Vector: 
pBluescript II KS(+); Site_1: ECORI; Site_2: NotI Host: Eschericl

Specifically, it refers to members of the S2/HtrA serine protease family, such that it plays a role in cellular physiology and apoptosis. The present invention provides agonists, antagonists, antibodies and recombinant expression vectors useful in methods of treatment, or detection and diagnosis of diseases associated with the abstrant expression or activity of the S2 serine protease, PRSS11-L. Accordingly, compositions described herein can be used via gene therapy routes to treat osteopathic, stress and apoptotic disorders. As such, they exhibit osteopathic, antiarthritic and tranquiliser activities. This polynucleotide sequence is the human PRSS11-L CDNA sequence of the invention.

TANGO protein is used to identify a compound which binds to it that can be used for modulating its activity. It is also used to produce an antibody. The antibody is used to detect the presence of the polypeptide in a sample. TANGO DNA and protein are useful as modulating agents in regulating cellular processes. They can be used in vaccines. TANGO DNA and protein and its antibody are used in e.g. chromosomal mapping, tissue typing, forensic biology, predictive medicine, pharmacogenomics and treatment methods. TANGO DNA is used in antisense gene therapy. The present sequence is mouse TANGO DNA, Note: This sequence SEQ.ID.NO:9 is said to encode the protein AAEZ6441, but this is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         29-JUN-2000;
